

## Truss Jib

Truss Jib - A truss jib is used to pick up and place trusses. It is actually an extended jib attachment which is outfitted along with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on equipment such as a compact telehandler, a skid steer loader or a forklift utilizing a quick-coupler attachment.

Older style cranes that have deep triangular truss jibs are normally assemble and fastened with bolts and rivets into standard open structural shapes. There are seldom any welds on these kind jibs. Every bolted or riveted joint is prone to rust and thus needs regular upkeep and check up.

Truss jibs are built with a back-to-back collection of lacing members separated by the width of the flange thickness of another structural member. This particular design can cause narrow separation amid the flat surfaces of the lacings. There is limited access and little room to clean and preserve them against rust. Lots of rivets loosen and rust within their bores and should be replaced.
